EVOLUTION S TO NOT-TO-BE-MISSED EDGEBOARDING EVOLUTION FOR SMALL AND MEDIUM- SIZED FIRMS INDUSTRIAL TECHNOLOGY WITH MINIMAL DIMENSIONS AND INVESTMENT

The new EVOLUTION S two-sided edgebanding machine with panel squaring function is a step forward in edgebanding technology. In fact, it's **the first industrial model on the market** to also provide the **panel squaring function in reduced dimensions** compared with the alternatives marketed by other manufacturers. Evolution S perfectly combines the technological wealth and productivity of edgebanding machines designed for the medium/high sector with the reduced dimensions and minimal investment that are essential in the small/medium firm (its target).

NATURAL TECHNOLOGICAL UPGRADING

Evolution S offers not only a double shoulder for the simultaneous machining of the two panel sides, but **also a panel squaring function** that immediately resets the correct panel geometry and dimension when necessary. And all this with investments similar to those for an average single-sided edgebanding machine.

UNEXPECTEDLY SIMPLE

Working with Evolution S is **extremely simple**. The operator can, in fact, use the same skills learnt on a traditional single-sided edgebanding machine, without needing any further training.

THE TECHNOLOGICAL EVOLUTION BASED ON EXPERIENCE

Evolution S can be configured with the same technology used in the STEFANI product

range - the result of over 60 years of tireless research in the field of panel edgebanding: reliable and efficient working units, with customisable degree of flexibility; the possibility to machine both traditional and innovative materials, the smart and multi-quality management of the gluing technology.

Evolution S is a real technological leap forward for structured small-and medium-sized firms that want to optimise their production costs with the aid of a machine that guarantees higher productivity with the minimum investment.

Evolution S di Stefani will be presented at **Thiene (VI), via del Lavoro 1/3 - 36016**
